HPD

The hpd app is a full crud application that uses a restful api for it's basic operations. It allows the viewing and manipulation of data that comes from three tables (owners, items, and owneritems). These are all a part of the same database that should have been included with the app.

Getting Started

Once you have downloaded all of the necessary files, import the hpd_database into your local environment. The database has been preloaded with sample data so that you can explore the app before using it.

After you have imported the database make sure that the hpd2 and api files are both in the same directory in your PHP engine. Now run index.html (located in the hpd2 file) with your favorite web browser. The gui should now display for you and you are free to test any features you would like.

Some basic functionalities include:

• View a owner's associated items by clicking on the owner's row in the table.
• Add an owner by pressing the green plus
• While viewing an owner's associated items, add an item to their list by pressing the green plus.
• Edit owners or items by pressing edit located on the right-hand side of any row.
• Delete owners or items by pressing delete located on the right-hand side of any row.
